# Data as Sparse Matrices

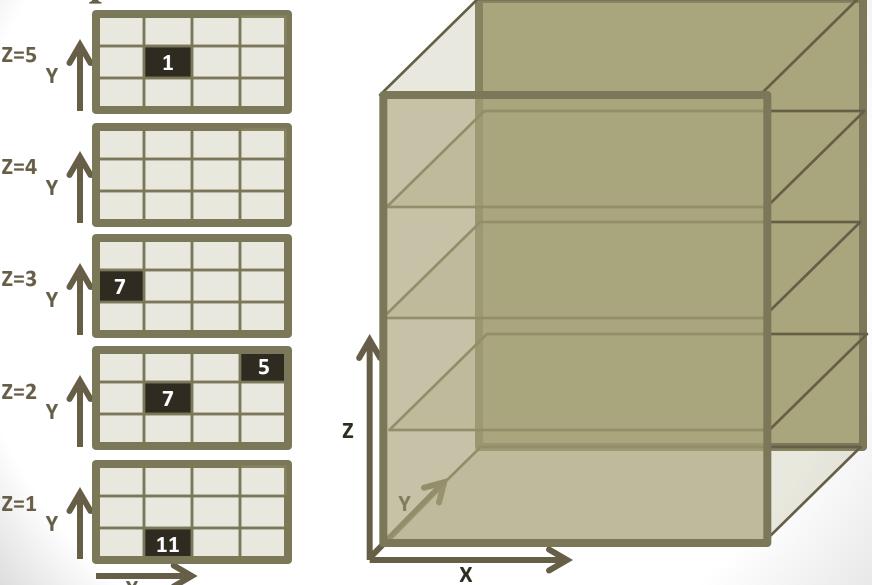

#### Cartesian Product

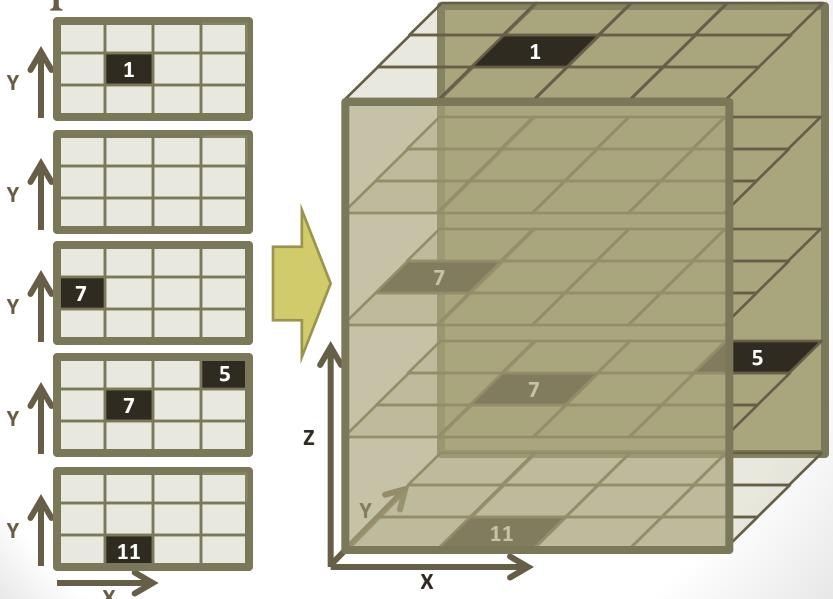

- Cartesian product
- http://en.wikipedia.org/wiki/Cartesian product
- The Cartesian product of two sets A and B is the set of all ordered pairs ab, where a is element of A and b is element of B.
- Relational Algebra
- http://en.wikipedia.org/wiki/Relational algebra
- In Relational Algebra we need the Cartesian product to combine tuples into a single tuple. The Cartesian product creates a new schema (relation) from other relations.
- Hyperrectangle (Sparse Multi-Dimensional Matrix)
- http://en.wikipedia.org/wiki/Hyperrectangle
- Hyperrectangle is the generalization of a rectangle for higher dimensions and is defined as the Cartesian product of intervals

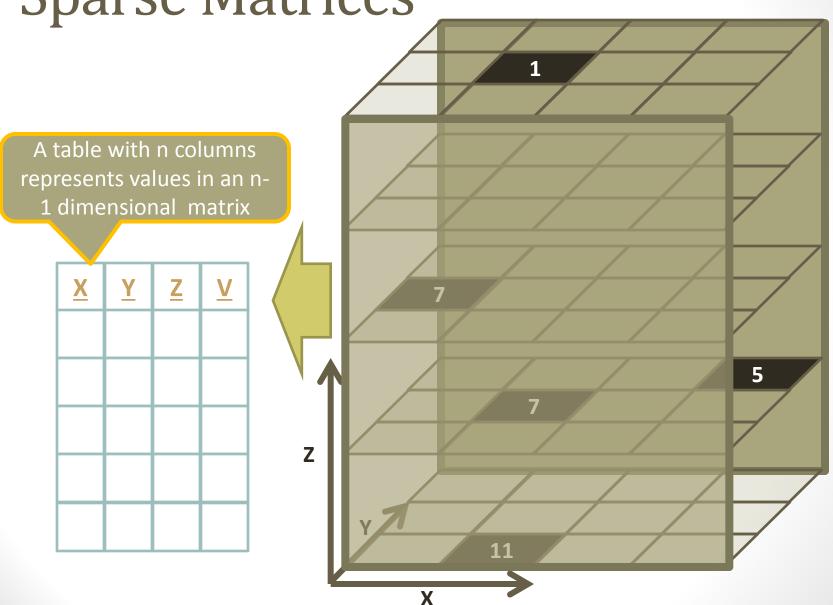

A series of equal-sized 2-dimensional matrices is a 3-dimensional matrix

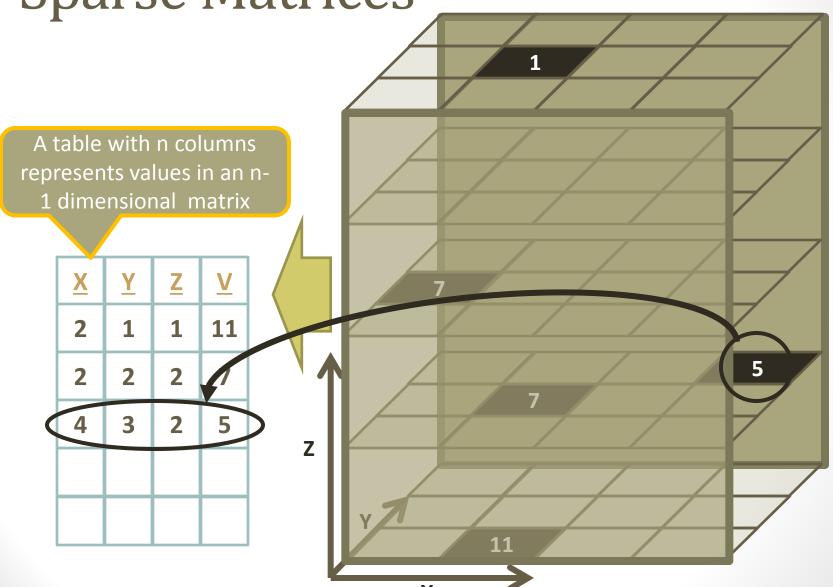

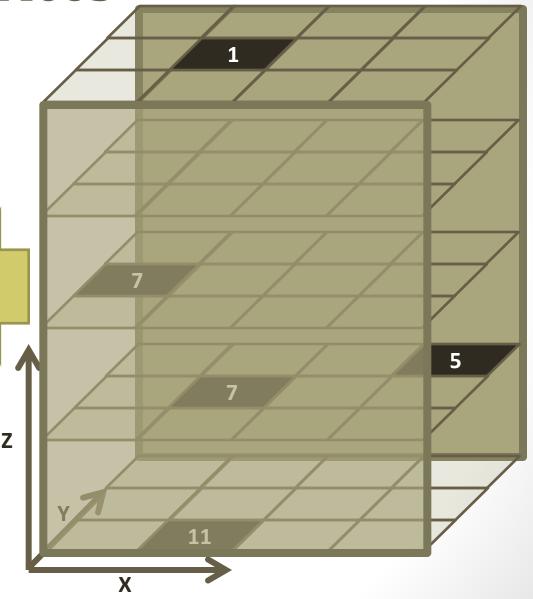

Sparse Matrices A table with n columns represents values in an n-1 dimensional matrix  $\underline{\mathsf{X}}$ 

Sparse Matrices A table with n columns represents values in an n-1 dimensional matrix  $\underline{\mathbf{X}}$ 11

A table with n columns represents values in an n-1 dimensional matrix

<u>X</u>	<u>Y</u>	<u>Z</u>	<u>V</u>
2	1	1	11
2	2	2	7
4	3	2	5
1	2	3	7

- Can we represent all tables in a single schema?
- Any table or matrix cell can be described by row, column and value.
- Represent each cell of a table in its own row.
- Entity-attribute-value model

Column Name

Row ID. Needs to be unique for a given row in the original table. Does not need to be a number or sequential (ordinal) number

<u>X</u>	<u>Y</u>	<u>Z</u>	<u>V</u>
2	1	1	11
2	2	2	7

#### Homework: Matrices (17)

#### • Main Point:

- Condensing information from multi-dimensional entity is good but not the main point.
- The main point is to convince you that the last two tables represent multi-dimensional matrices (Hyper-rectangles, or Cartesian products of their intervals)

#### Further Lessons:

- These tables abide by the rules of relational algebra
  - Rows are unique
  - Columns have headers
  - Row order is irrelevant
- Relaxed Layout / Schema
- Extensible: New tables can be added without disrupting the schema

 Schema change can happen by adding rows (tuples) to a table that indexes another table

#### Schema Change Proved

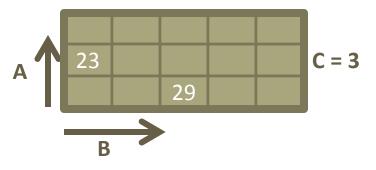

#### Schema Change Proved

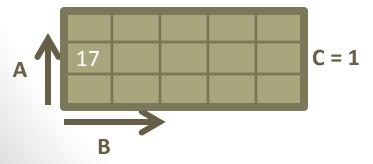

#### Schema Change Proved

#### Sparse Matrices: Assignment

- Data: Real estate survey of single-family houses in downtown Seattle. Cell values are number (N) of houses found for sale.
  - A: Area in 1000's of square feet
  - **B**: Number of Bathrooms
  - **C**: Cost in \$100,000.-
- Task: Create sparse matrices of the type in the previous slide. See the following Assignment slide for elaboration.

#### Sparse Matrices Assignment

- 1. Create the two tables that result from the "Sparse Matrices: Assignment" slide.
  - a) Table 1 will have as headers: A, B, C, & N.
  - b) Table 2 will have as its headers: R, C, & M.
- Change the schema by changing Table 2. The new values will represent Cost per Square Foot.
- 4. SQL on Sparse Matrices. Given that sparse matrices are encoded with the EAV schema do the following:
  - a) Write SQL for Scalar Multiplication of a Sparse Matrix
  - b) Write SQL for Transpose of a Sparse Matrix
  - c) Optional: Write SQL for Vector Multiplication
    - Inner Product (Dot Product, Scalar Product)
    - ii. Outer Product (Cartesian Product)
  - d) Optional: Write SQL for Matrix Multiplication
- 5. Submit Completed Assignment

### Data as Sparse Matrices
